## How many languages

### Abstract

This paper establishes the XXX model to predict the trends of global languages and provide the best recommendations about the location of international office for a multinational company.

Firstly, in order to predict how languages of the world may vary over time, we build a prediction model, using data we collected from **Twitter** and other sources. Using this model, we predict the trends of native speakers and total language speaks in the next 50 years and find that ... .

Secondly, based on the result our model produces, we use K-means algorithm to help us locate the best place for the company's global offices, taking the population and location of capital of every country into consideration. And we compare our recommendations with the global office chosen by world top 500 to verify our method and get great results.

Thirdly, we studied how would our model's results change with the type of our client company....

# How many languages

# **1 Introduction**

## **1.1 Background**

## **1.2 Restatement of the Problem**

We are required to build a model to predict the trends of global languages, including the number of speakers and the geographic distribution change of the top-10 languages. Then we need to decide where the new international offices of the company should be located, or take efforts to reduce the number of offices.

# **2 Basic Assumptions**

## **2.1 Assumption 1.**

We assume that the land area of every country doesn't change during the period of time we study.

## **2.2 Assumption 2.**

We ignore unpredictable or low-probability events that may cause great impact to languages trends.

### 3 Analysis of the Problem

### 4 Models and Methodology

### 5 The Model Results

### 6 Validating the Model

### 7 Conclusions

### 8 A Summary

### 9 Evaluate of the Mode

### 10 Strengths and weaknesses

#### 10.1 Strengths

- **Applies widely**

This system can be used for many types of airplanes, and it also solves the interference during the procedure of the boarding airplane, as described above we can get to the optimization boarding time. We also know that all the service is automate.

- **Improve the quality of the airport service**

Balancing the cost of the cost and the benefit, it will bring in more convenient for airport and passengers. It also saves many human resources for the airline.

- 

#### 10.2 Weaknesses

- ...

- ...
